

MicroCMS

MicroCMS Quick Start Guide

An easy-to-install, easy-to-use micro CMS — the key steps for site administrators

Version 1.0

1. Sign in to the back office

Open `/admin` and sign in with the administrator account, then change the default password from your profile right away.

2. Configure the site

System → **Settings**: site name, logo (.png), favicon (.ico), languages, time zone, contact details and social media.

3. Upload files

File manager: upload images and documents into folders. Thumbnails and WebP versions are generated automatically.

4. Create content

Create article categories and articles, banners, pages (rows, columns and widgets), an intro page and popups from each module menu.

5. Build the front menu

System → **Menu**: link menus to pages, categories, articles or the contact page, choose the home menu and drag to reorder.

6. Style it with a template

System → **Template**: configure the header, body, footer, side menu, loading screen and custom CSS.

7. Users and permissions

Create user groups, grant per-module permissions and add users to groups. Every action is recorded in the history logs.

Before going live

- Set **APP_URL** to your real domain and change the default administrator password.
- Add a cron entry for **php artisan schedule:run** every minute so view counts are saved.
- Configure SMTP for password-reset emails, and Turnstile to enable the contact form.
- All sample data can be edited further or deleted.
